Hi Christine,

I have just had a conversation with Martin Buckley to further explain the piling at my home.

The total weight of the rig to be used is a total of 450 kg. This is probably one of the lightest rigs available to carry out this type of work. The rig will be sat on a small sheet of plywood whilst the hammer is released to drive the piles, it will also be set up inside the build area which means the ground which is set up on will actually be dug down to accommodate the floor beams design which has been submitted at first planning stage. I hope this helps .

Kind regards

Mark Mason
